## Usage

Before application read carefully instructions on the container and use according to the manufacturer's recommendations.

## Recommended substrate conditions

Proper surface preparation has huge influence to final result. Fundamental principle, which relate to all surfaces prepared to painting is to grind, degrease and let it dry.  
Primed surface should be grinded with fine-grained abrasive paper previously.  
Compatible with all paint systems (alkyd, acrylic, nitro-combination) water and solvent based as well.

## Method of use

Apply product at temperature about 15-25°C (optimum temperature for good varnish drying).  
Drying time depends also on air humidity and product density.  
Painting should be made in well ventilated room.  
Prior to commencing painting, shake the container for about one minute, what helps mix the varnish by the ball inside.  
Perform the test spray.  
Apply the varnish with few thin layers rather than one thick layer, from the distance of 25-30 centimetres.  
Wait few minutes between each layer when applying.  
When finished, clean the nozzle.  
Put the container upside down, pressing the nozzle for the period of three seconds.
